Assignment 5

Due Sunday by 11:59pm   **Points** 100   **Available** after Mar 29 at 12am

---

25% of total assignment grade.

Note:

- You can discuss this assignment with your teammate.
- Though this is not a team assignment, work with your teammate closely and help one another.

1. Submit everything in your svn directory as before.Grab your teammates code and put it in a seperate folder within your folder. For instance just like christia/dominion create christia/teammate1Dominion and christia/teammate2Dominion. Copy paste your tests into their directory and run your tests. You can use your makefile to run the tests or you can run them one by one. Report any bugs you found out to your teammate. You need to report 2 bugs to your teammate in total. In case you cannot find out any bugs in your teammates' code, mention in in your report. Name your report BugsInTeammates.txt (40 points for running your test against teammates' code with intention of finding few bugs and 10 points to find atleast a bug. So, if you cannot find out any bug, you will loose only 10 points). Please note that you may need to change your tests in order to match the refactored code. Based on how your teammates refactored the code, what are the method names, what are the parameter passed, you have to change your tests. This will also indicate how maintainable your tests are.

2. Fix all the bugs that are found in your code.. First fix the bugs that your teammate found then fix the bugs that you introduced. Use GDB to debug your code and fix it. Provide a documentation file to discuss which bugs you fix and mention your code changes. Provide a documentation file BugFixes.txt. In case your teamates already fixed the bugs and you cannot find out any bugs, Find out the version they just submitted for assignment 2 and use that version. It will give you better practice with svn and repository and repository history.
